

DECENTRALIZED MESSAGING ON STELLAR

dMessage

Escape the surveillance. Own your conversations.

Your conversations belong to you — not corporations. A decentralized, end-to-end encrypted messaging platform built on Stellar.

Presented by: Richie Christian De Guzman

Made with GAMMA

Privacy Is Broken

Over **3 billion users** send private messages daily through centralized platforms that collect data, analyze metadata, monetize conversations, and train AI models — all without your consent. Users are forced to choose between convenience and privacy. The internet was never designed this way.

3B+

Messaging Users

Exposed to centralized surveillance every day

\$200B

Surveillance Economy

Personal data monetized without user consent

72%

of Users

Unaware their metadata is being harvested

Your Messages Should Never Become Someone Else's Business Model

What Centralized Apps Demand

- Centralized infrastructure you don't control
- Company-controlled identities
- Server-side trust as a requirement
- Metadata, contact graphs, and identity exposed

□ **Privacy should not depend on trusting a corporation.** Even "encrypted" apps leak metadata, contact graphs, and user identity.

OUR SOLUTION

Introducing dMessage

Private by Design. Decentralized by Default.

Wallet Identity

Your Stellar wallet is your identity — no email, no phone number

Client-Side Encryption

Messages encrypted before they leave your device

IPFS Storage

Encrypted data lives on decentralized IPFS — not corporate servers

Blockchain Proofs Only

Stellar stores only immutable hashes — nobody can read your conversations

Why Stellar?

Stellar provides everything needed for decentralized communication at near-zero cost.

- Six advantages of Stellar for dMessage:
Extremely low transaction costs (pennies per operation)

- Fast finality (3-5 second confirmations)

- Secure Soroban smart contracts (WASM-based)

- Excellent wallet ecosystem (Freighter, Albedo, etc.)

- Easy onboarding (familiar UX patterns)

- Sustainable network (energy-efficient consensus)

Architecture Principle

Instead of storing messages on-chain, Stellar stores only **immutable references** while IPFS stores the encrypted content. This dramatically reduces costs while maintaining full decentralization.

~\$0.00001
Per transaction

3-5s
Finality time

How It Works

Every message is encrypted, distributed, and verifiable — with zero plaintext ever touching a server.

Key Exchange

Encrypt & Upload

Store Hash

Retrieve & Decrypt

Only encrypted hashes reach the blockchain. **Nobody else can read the message** — not ISPs, not governments, not even us.

System Architecture

Three Soroban Contracts

User Registry

Maps wallet addresses to usernames and public keys

Social Graph

Manages contact relationships and permissions

Message Contract

Stores immutable IPFS hash references with timestamps

Only encrypted hashes reach the blockchain.
No message content is ever stored on-chain.

Security-First Design

End-to-End Encryption

X25519 ECDH key exchange with AES-GCM-256 via Web Crypto API — zero plaintext exposure

Decentralized Storage

IPFS ensures no single point of failure or data control

Immutable Metadata

Soroban smart contracts provide tamper-proof message references

Open Source

Anyone can audit the code. Future: independent audits, formal verification, bug bounty

Market Opportunity & Competitive Advantage

Target Users

Individuals

Privacy-conscious users

Journalists & NGOs

Secure source protection

DAOs & Devs

Decentralized orgs

Enterprises

Compliance-ready teams

How We Compare

Feature	WhatsApp	Telegram	Signal	dMessage
End-to-End Encryption	✓	Optional	✓	✓
Decentralized	✗	✗	✗	✓
Blockchain Identity	✗	✗	✗	✓
Open Smart Contracts	✗	✗	✗	✓
IPFS Storage	✗	✗	✗	✓
Wallet Login	✗	✗	✗	✓

Business Model & Roadmap

Revenue Streams

Premium Storage

Expanded IPFS pinning
for power users

Developer APIs

White-label and API access for integrations

Enterprise Platform

DAO and team
communication
infrastructure

Roadmap

Q3 2025

Mainnet
deployment,
security audit,
source verification

2026

Mobile apps, voice
messaging, video
calling, cross-chain
identity

Q4 2025

Group messaging,
read receipts,
reactions,
notifications

Future

DAO governance,
enterprise
messaging, on-
device AI
organization
